Download by Paul Arnold Downloaded September 17, 2000 Copyright (C) Paul Arnold 2000 siege 1.5.0 contains the very latest features and bug fixes! A hard-on for speed: siege supports large files in multiple file formats. Files with large amounts of data are automatically split into separate files. You can view huge video files (10GB+) in real-time. Each file is read sequentially and does not need to be re-read in subsequent passes. You can also read the entire file in one pass. Multi-threading of the video and audio codecs (FFMPEG, etc.) is enabled. The siege engine now supports a wider range of codecs than ever before, including H.264 (3D), MPEG-4 (WMV), and VP3. siege does not depend on any specific file format, nor does it limit the size of the file or the amount of data you can read. Two separate options allow you to optimize for speed: With the -s (--speed) option, you can set the number of simultaneous files being read. With the -p (--parallel) option, you can set the number of simultaneous threads. Multiple files of the same format are automatically merged into a single file. If you need to read multiple files of different formats, you can specify a different "format" file name and each other file's "format" field will be used as the filename (e.g., file1.mkv, file2.avi, and file3.mp4). Special Features: Optionally, you can specify the maximum height of the video frame when reading and writing files. Optionally, you can specify the maximum width of the video frame when reading and writing files. siege can convert between two file formats (TAR/TAR.MOV to MPEG-2/MOV). Optionally, you can supply an encoding profile from the FFmpeg library when reading and writing files. Optionally, you can supply the quality setting for encoding. Optionally, you can specify the output video format. Optionally, you can specify the audio format. Optionally, you can specify the 82157476af
